

# MACHINE LEARNING METHODS IN NUMERICAL SIMULATIONS

Ivan Oseledets

Skolkovo Institute of Science and Technology  
and Institute of Numerical Mathematics RAS, Moscow, Russia

Machine learning methods and associated technologies and software frameworks open new ways for doing numerical simulations. Such methods can be applied in different ways: they can be used to construct reduced order models from time-consuming simulators, or even learn the dynamical systems from the data and observations, and also allow to efficiently perform optimization and optimal design. I will highlight some recent results and also outline some open problems.
